1.

The project that we selected was an Event Portal where people can find events to attend, and send a RSVP. It would also be an aid to help event planners by making planning an ease. The website would be dynamic since event hosts would be constantly adding events.

This project is important to help people keep their events organized. Running an event can be very complicated. Having to track down all the vendors needed can be daunting, and having a one stop solution greatly improves event organizers abilities to run an event. This project also tackles another major problem for people hosting events, namely making the event known to others.

2.

2a)

How this Project meets the listed criteria.

- The Project will be web-based, hosted locally via a service like Docker for demonstration and testing purposes. We will host this website during development.
- The roles within the project will be as follows
 - Event Hosts
 - These users will be able to create new events visible to other users, they will be able to create or update relevant information such as event descriptions, locations and dates. They will also be able to get in contact with Service Providers to plan services such as catering, music or more.
 - Admins
 - The Admins will be used for managerial purposes such as removing events that violate the terms of service of the website and adding or removing Service Providers as necessary.
 - Participants
 - Participants will be able to see events and request attendance within them or place RSVP's for events they wish to participate in.
 - Service Provider
 - Service Providers will be able to communicate with Event Hosts to provide their services to planned events, they will be able to see events that still require their field of expertise, and reach out to those Hosts to begin a conversation.

- The project will be dynamic in nature, where the home page updates to show active events, numbers of participants and more. Users will be able to use buttons, search bars or links to access or update whatever part of the site they need to complete their task.
- We believe this project will be feasible within 8 weeks with 3 people dedicating 5 work hours to it per week. It should provide an adequate challenge as we encounter new obstacles we have not had to overcome before. We believe this project will be completed by the 5th of December as required by the requirements outline.

2b)

The business need covered by this project are:

- **Vendor Availability:** Trying to find options for catering, music, event decoration, and other vendors can be difficult. Our project would provide a list of vendors to event organizers for specific categories, helping them plan their event faster.
- **Centralized Discovery:** Events are often difficult to find, spread across various websites and posters. People miss opportunities. Our project provides a single, searchable directory.
- **Group Organization:** Lots of people go to events without others, but would love to meet them. Our project will let people form a group to meet up for an event, providing an icebreaker to helping others find new people with similar interests.

2c)

The primary stakeholders for this project will be the event attendees, the event organizers and service vendors.

- Organisers
 - These users have an interest in the website as they will have the most work to do within the website and they want a service that will allow them to easily reach their target audiences the most effective and efficient way possible.
- Vendors
 - These users will have an interest in this website as a way for them to provide their services to more events. They will want a way to effectively get in contact with those that may need their services.
- Attendees
 - These users will be interested in the website because they will be its primary user base. They will want to be able to find and sign up for events with as little hassle as possible.

2d)

Project Goals:

Primary:

- Hosts can create Events
- Hosts can edit information about their event (Location, Price, Etc.)

- Hosts can decide what services their event requires from a list (Caterer, Music, Etc.)
- Admins can remove events
- Users can apply to attend events or make RSVP's
- Users can search for events
- Users can create a request make a service provider account
- Admins can approve or reject requests to make a service provider account
- Service Providers can search for events that still need their service (Caterer, Music, Etc.)

Secondary:

- Users can export events to their calendars
- Event hosts can add their own staff to the page
- Users can pull up the location of the event on a maps app
- Tags for filtering like certain bands or music genre
- Users can look for groups to go to the events with
- Users can select the meal they want if applicable

The vision of the project is one where an event organiser can easily log on, create an event, fill in the necessary fields and information and share that event to all users of the website. We hope to make the website as easy to use as possible for all users, adding ways to easily connect parties such as Hosts and Service Providers or Hosts and Attendees.

Disclosure: We used AI (ChatGPT) to brainstorm ideas, organize the brief, and polish wording. All decisions, structure, and final content were created, reviewed, and approved by us.
